## Geologic Map of the Center 7.5-minute Quadrangle, Jefferson County, Washington

Michael Polenz, Harley O. Gordon, Ian J. Hubert, Trevor A. Contreras, Annette I. Patton, Gabriel Legoretta Paulín, and Recep Cakir

İ	Qpu	<b>Undivided Quaternary sediment older than Vashon Till</b> —Sand, pebble gravel, silt, clay, diamicton, organic sediment, and boulders, in varied abundance; color and weathering varied;
		compact; varied grain size, rounding, sorting, and bedding.
	Tertiary	y Sedimentary and Volcanic Bedrock
l	ΦEm	<b>Undifferentiated sedimentary rocks (late Eocene to early Oligocene)</b> —Mudstone and siltstone with less common sandstone or claystone; some exposures micaceous; dark to pale-brown in weathered exposures, medium to dark-gray where fresh; locally nodular and hackly in outcrop.
	Em <sub>2t</sub>	<b>Townsend Shale (late Eocene)</b> —Mudstone, siltstone, and sandstone; commonly micaceous, in places calcareous; brown to gray; spheroidal to hackly weathering common.
	Em <sub>2ss</sub>	<b>Sandstone of Snow Creek (late Eocene)</b> —Sandstone, siltstone, and mudstone; in places calcareous; gray to brown; well to moderately sorted; angular to subangular.
	LYRE F	FORMATION (MIDDLE EOCENE)
1	Em <sub>2ls</sub>	<b>Lyre Formation sandstone and mudstone</b> —Sandstone, siltstone, and mudstone; thickly bedded; well indurated; quartzose and lithic.
e;	Evtl	<b>Lyre Formation volcanic tuff and breccia</b> —Hornblende dacite to andesite breccia with rare lithic tuff interbeds; gray to pale red or brown.
1	Em <sub>2lc</sub>	<b>Lyre Formation conglomerate</b> —Pebble to cobble conglomerate with lenses of sandstone; tan or brown to gray; well indurated; rounded to subrounded; poorly sorted; generally thickly bedded; clasts mostly chert, lesser quartz, basalt, and other rocks.
	CRESC	ENT FORMATION (EARLY TO MIDDLE EOCENE)
	Em <sub>1c</sub>	<b>Crescent Formation sedimentary rocks</b> —Basaltic conglomerate, sandstone, and mudstone, in places calcareous; dark gray to brown or black, or pale yellow to orange; well indurated; mostly pebble- to cobble-size clasts; poorly sorted; dominantly basaltic clasts with a few clasts of basaltic sedimentary rock.
2,	Evc	<b>Crescent Formation basalt</b> —Basalt, typically in aphanitic flows or breccia with rare pillows; gray to yellow-brown; spheroidal exfoliation common.
	GEOLO	DGIC SYMBOLS
	?	Contact—Solid where location accurate; long dash where approximate; short dashed where inferred; queried where location or existence uncertain
	- <u>-</u> ?	Reverse fault—Short dash where inferred; dotted where concealed; queried where location or existence uncertain; rectangles on upthrown block
		High-angle dip-slip fault—Solid where location accurate; short dash where inferred; dotted where concealed; queried where location or existence uncertain; relative movement shown by U and D
	Α ——	- A' Cross section line
	Rigg A	A Peat profile location from Rigg (1958)
		Former shoreline—Identity and existence certain, location accurate
	<b></b>	Scarp identified from lidar—Identity and existence certain; location accurate; hachures on downslope side
	29	Bedding—showing strike and dip
	40'-	Approximate bedding—showing strike and dip
	$\sim _{5}$	Crenulated, warped, undulatory, or contorted bedding-showing strike and dip
;	$\oplus$	Horizontal bedding
		Approximate horizintal bedding
	- <b>&gt;</b> 0	Current flow-direction indicators (flutes, people imprication, etc.)—showing bearing and plunge
		Loint showing strike and din
	74	John — showing suike and up
0	<b>→</b> 0	Minor fold—showing bearing and plunge
-	38	Minor fault—showing strike and dip
	47	Shear—showing strike and dip
	GD1 🔺	Age sample, radiocarbon ( <sup>14</sup> C)
	GD2 🔆	Age sample, optically stimulated luminescence
	GD14 🈡	Age sample, fossil
	G2 🔶	Geochemistry sample location
	В1 -ф-	Geotechnical boring
	S6 🔶	Significant site
	W07 _	Water well
	0
